

Identify opportunities to improve IT readiness, reduce costs

Long-term and post-acute care providers must maintain a better-than-average technology infrastructure if they want to succeed in the new healthcare environment. Those looking to improve their current and future business outlook are turning to IT assessments as a cost-effective means of (1) knowing their current IT status and readiness for future IT expansion, and (2) understanding how they compare to their healthcare provider peers.

An IT assessment provides an independent evaluation of your IT infrastructure as it compares to industry best practices and norms. It identifies areas of opportunity to cost effectively improve your business technology and offers a strategy for leveraging resources for better health care delivery and future business success.

Our IT assessment concentrates on your current IT infrastructure and includes a thorough onsite inspection, formal documentation of findings, a gap analysis, and informed recommendations from a team of highly experienced IT personnel who work extensively with LTPAC communities. All assessment components contribute to a cohesive roadmap that will help you fulfill your current IT needs while preparing you for necessary future initiatives.

Contact vcpi to get an expert evaluation of your current IT infrastructure as it compares to industry best practices...

Your advantage

- Network infrastructure and services, such as corporate network devices and wireless LAN/WAN architecture
- Data center infrastructure
- Corporate messaging infrastructure, including hardware and design best practices
